Social Network Analysis for Computer Scientists Fall 2017 — Assignment 1

http://liacs.leidenuniv.nl/~takesfw/SNACS

Deadline: October 2, 2017

This document contains 2 exercises that each consist of various numbered questions that together form Assignment 1 of the Social Network Analysis for Computer Scientists course taught at Leiden University.

For each question, the number of points awarded for a 100% correct answer is listed between parentheses. In total, you can obtain 100 points and 10 bonus points. Your grade is computed by dividing your number of points by 10. Please do not be late with handing in your work. You have to hand in the solutions to these exercises individually. Discussing the harder questions with fellow students is allowed, but writing down identical solutions is not. Hand in your solutions, typeset using IATEX, via the link at the course website.

For each question, clearly describe how you obtained your answer. Write down any nontrivial assumptions that you make. For the exercises that require some programming, you can use any programming language, scripting language or toolkit. All practical exercises can be done on the student workstations. In any case, always clearly describe which toolkit or programming language you used and how you obtained your answer using these tools. Include relevant source code (for example, in an Appendix).

Questions or remarks? Contact the lecturer or assistant via e-mail or ask your questions during one of the weekly lectures or lab sessions. Good luck!

Exercise 1: Neighborhoods (40p)

A directed graph G=(V,E) consists of a set of nodes V and a set of directed links E. For the number of nodes |V| we use n, and the number of links |E| will be denoted by m. The neighborhood N(v) of a node $v \in V$ is defined as the set of nodes to which v links:

$$N(v) = \{ w \in V : (v, w) \in E \}$$

Similarly, the reverse neighborhood N'(v) can be defined as the set of nodes that links to node v:

$$N'(v) = \{ u \in V : (u, v) \in E \}$$

The notion of a neighborhood can be extended by defining the neighborhood of a set of nodes W as:

$$N(W) = \{ w \in V : v \in W \land (v, w) \in E \}$$

For convenience, for a node $v \in V$ we say that $N(v) = N(\{v\})$. Next, we say that the k-neighborhood $N_k(W)$ is defined as all nodes that are between 0 and k steps away from nodes in W. For the case k = 0 we have $N_0(W) = W$. Then for k > 0 we have:

$$N_k(W) = N(N_{k-1}(W)) \cup N_{k-1}(W)$$

Essentially, the k-neighborhood allows us to apply the neighborhood function to a set of nodes k times. Using these notions, it is possible to define other metrics, procedures and algorithms.

- (4p) Question 1.1 Give a formal definition of the indegree and outdegree of a node using the notion of a (reversed) neighborhood.
- (4p) Question 1.2 Define the reciprocity of a directed graph using the notion of (reversed) neighborhoods.
- (5p) Question 1.3 The radius of a connected undirected graph is the minimal eccentricity (which is the maximal distance to another node from that particular node) over all nodes in the graph. How can we use the neighborhood function to define the radius?
- (4p) Question 1.4 What type of graph could we be dealing with if for all pairs of nodes $u, v \in V$ we have: $|N_k(u)| = |N_k(v)|$ for any $k \ge 0$?
- (10p) Question 1.5 Give an algorithm that uses the neighborhood function to count the number of cliques of size 4 in a connected undirected graph. What is the time complexity of your algorithm?

From here on, assume that given a particular starting node in a connected undirected graph, your only accessible function is N(v), so querying a previously discovered node v's neighborhood.

- (6p) Question 1.6 Write an algorithm that computes the density of the graph.
- (7p) Question 1.7 Give an algorithm to check whether the graph is bipartite.

Exercise 2: Mining An Online Social Network (60p)

This is a practical exercise, for which you can use any toolkit or programming language. Network datasets can be found in the Leiden ULCN environment in the shared UNIX folder: /vol/share/groups/liacs/scratch/SNACS/ The relevant files are named medium.in and large.in and have UNIX line endings. For convenience and speed, you should copy the files located in that folder to the local hard disk /scratch/ of the machine you are working on. Each file contains a list of friendships of an online social network of the form userA[whitespace]userB[newline] and represents one directed link from a person identified by userA to a person identified by userB. You may assume that these identifiers are integers that fit in a 4-byte signed int in C⁺⁺. Processing the file medium.in should be possible on a student workstation with 16GB memory, using for example GEPHI. A larger online social network is given in the file large.in. Loading and processing this file may take a considerable amount of computation time and memory, and will likely not be possible using standard toolkits such as GEPHI, but should be possible on a student workstation with 16GB memory using NETWORKX.

Answer each the following five questions for **both** of the datasets medium.in and large.in (hence, points are also given $2\times$), and remember to write down how you obtained your answer and to include any relevant source code.

- $(2 \times 2p)$ Question 2.1 How many directed links does this network have?
- (2×3p) Question 2.2 How many users (nodes) does this social network have? Hint: a node counts as a node if it is a source or a target of a link.
- (2×5p) Question 2.3 Give the indegree and outdegree distribution of this graph (so, for each degree value the number of times that it occurs). Present the results in a representative diagram, for example generated using a simple tool such as GNUPLOT or MATPLOTLIB.
- (2×5p) Question 2.4 How many weakly connected components and how many strongly connected components does this network have? How many nodes and links are in the largest strongly connected component of this graph?
- (2×5p) Question 2.5 Give the exact or approximated distance distribution of the largest weakly connected component of this graph as a diagram.
- (20p) Question 2.6 Visualize the social network in medium.in as a vector graphic so that it can be printed on A4 paper. Give the size and optionally the color of a node a sensible meaning based on node centrality, and explain your choices. Which visualization algorithm did you use, what parameters of the algorithm did you choose? Include your network as a full-page A4 vector graphic PDF in your report, or include it as a separate file.
- (10p, bonus) Question 2.7 The file huge.in contains over 5 million nodes and over 1 billion edges. Answer questions 2.1 through 2.5 above. You will need to use a more advanced software package and environment (e.g., GRAPH-TOOL), or write efficient code yourself.
